Intrinsic syntax of type theory

Categories with families (CwFs)

CwFs are a notion of model of type theory.

It can be presented as a generalized algebraic theory.

The initial algebra can be defined as a higher inductive-inductive type (HIIT) in type theory, which can be seen as an intrinsically typed syntax of type theory.

Components of a CwF

A category Con of contexts and substitutions

$\text{Con} : \text{Type}$

$\text{Sub} : \text{Con} \rightarrow \text{Con} \rightarrow \text{Type}$

$\text{id} : \text{Sub } \Gamma \Gamma$

$- \circ - : \text{Sub } \Delta \Gamma \rightarrow \text{Sub } \Theta \Delta \rightarrow \text{Sub } \Theta \Gamma$

$\text{idl} : \text{id} \circ \sigma = \sigma$

$\text{idr} : \sigma \circ \text{id} = \sigma$

$\text{assoc} : \sigma \circ (\delta \circ \theta) = (\sigma \circ \delta) \circ \theta$

with a terminal object

$\diamond : \text{Con}$

$\text{Sub } \Gamma \diamond \cong \mathbb{1}$

Components of a CwF (cont.)

A presheaf Ty over Con

$$\text{Ty} \quad : \text{Con} \rightarrow \text{Type}$$

$$-[-] \quad : \text{Ty } \Gamma \rightarrow \text{Sub } \Delta \Gamma \rightarrow \text{Ty } \Delta$$

$$[\text{id}] \quad : A[\text{id}] = A$$

$$[\circ] \quad : A[\sigma \circ \delta] = A[\sigma][\delta]$$

A presheaf Tm over $\int \text{Ty}$

$$\text{Tm} \quad : (\Gamma : \text{Con}) \rightarrow \text{Ty } \Gamma \rightarrow \text{Type}$$

$$-[-] \quad : \text{Tm } \Gamma A \rightarrow (\sigma : \text{Sub } \Delta \Gamma) \rightarrow \text{Tm } \Delta (A[\sigma])$$

... (+ functoriality)

Context comprehension

$$-\triangleright - \quad : (\Gamma : \text{Con}) \rightarrow \text{Ty } \Gamma \rightarrow \text{Con}$$

$$\text{Sub } \Delta (\Gamma \triangleright A) \cong (\sigma : \text{Sub } \Delta \Gamma) \times \text{Tm } \Delta (A[\sigma])$$

$U \quad : \text{Ty } \Gamma$

$U[] \quad : U[\sigma] = U$

$\text{El} \quad : \text{Tm } \Gamma \text{ } U \rightarrow \text{Ty } \Gamma$

$\text{El}[] \quad : (\text{El } t)[\sigma] = \text{El}(U[]_*(t[\sigma]))$

$\Pi \quad : (A : \text{Ty } \Gamma) \rightarrow \text{Ty}(\Gamma \triangleright A) \rightarrow \text{Ty } \Gamma$

$\Pi[] \quad : (\Pi A B)[\sigma] = \Pi(A[\sigma])(B[\sigma^+])$

... (+ term formers)

The wild syntax

The type interpretation of the wild syntax

Interpretation into the standard/metacircular/type model

$$\begin{aligned} \llbracket \Gamma \rrbracket & : \text{Type} \\ \llbracket \sigma \rrbracket & : \llbracket \Delta \rrbracket \rightarrow \llbracket \Gamma \rrbracket \\ \llbracket A \rrbracket & : \llbracket \Gamma \rrbracket \rightarrow \text{Type} \\ \llbracket t \rrbracket & : (x : \llbracket \Gamma \rrbracket) \rightarrow \llbracket A \rrbracket x \\ \\ \llbracket \text{id} \rrbracket x & := x \\ \llbracket \sigma \circ \delta \rrbracket x & := \llbracket \sigma \rrbracket (\llbracket \delta \rrbracket x) \\ \llbracket A[\sigma] \rrbracket x & := \llbracket A \rrbracket (\llbracket \sigma \rrbracket x) \\ & \dots \end{aligned}$$

Types do not form sets in the wild syntax

$\llbracket A \rrbracket : S^1$

$\llbracket U \rrbracket := \text{base}$ $\llbracket [id] \rrbracket := \text{refl}$

$\llbracket A[\sigma] \rrbracket := \llbracket A \rrbracket$ $\llbracket U[] \rrbracket := \text{loop}$

Hedberg's theorem: types do not have decidable equality

The set-syntax

The set-syntax

We add:

$$\text{isSetSub} : (p, q : \sigma = \delta) \rightarrow p = q$$

$$\text{isSetTy} : (p, q : A = B) \rightarrow p = q$$

$$\text{isSetTm} : (p, q : t = u) \rightarrow p = q$$

We cannot directly interpret the set-syntax into the set model, since set is not an set.

The groupoid-syntax

The groupoid-syntax

We replace `isSetTy` with

$$\text{isGroupoidTy} : (p, q : A = B) \rightarrow (\alpha, \beta : p = q) \rightarrow \alpha = \beta$$

and add coherences

$$\begin{array}{ccc} (\text{El } t)[\text{id}] & & (\text{El } t)[\sigma \circ \delta] \xrightarrow{[\circ]} (\text{El } t)[\sigma][\delta] \\ \text{El}[] \downarrow & \searrow [\text{id}] & \downarrow \text{El}[] \\ \text{El } (t[\text{id}]) & \xrightarrow{[\text{id}]} & \text{El } t \\ & & (\text{El } (t[\sigma]))[\delta] \\ & & \downarrow \text{El}[] \\ \text{El } (t[\sigma \circ \delta]) & \xrightarrow{[\circ]} & \text{El } (t[\sigma][\delta]) \end{array}$$

The set interpretation of the groupoid-syntax

$$\begin{aligned} \llbracket \Gamma \rrbracket & : \text{hSet} \\ \llbracket \sigma \rrbracket & : \llbracket \Delta \rrbracket \rightarrow \llbracket \Gamma \rrbracket \\ \llbracket A \rrbracket & : \llbracket \Gamma \rrbracket \rightarrow \text{hSet} \\ \llbracket t \rrbracket & : (x : \llbracket \Gamma \rrbracket) \rightarrow \llbracket A \rrbracket x \\ \llbracket \text{id} \rrbracket x & := x \\ \llbracket \sigma \circ \delta \rrbracket x & := \llbracket \sigma \rrbracket (\llbracket \delta \rrbracket x) \\ \llbracket A[\sigma] \rrbracket x & := \llbracket A \rrbracket (\llbracket \sigma \rrbracket x) \\ \llbracket \text{isGroupoidTy} \rrbracket & := \text{isGroupoidSet} \\ & \dots \end{aligned}$$

α -normalization (better name: ζ -normalization?)

$\text{NTy} \quad : \text{Con} \rightarrow \text{Type}$

$\text{U} \quad : \text{NTy } \Gamma$

$\text{El} \quad : \text{Tm } \Gamma \text{ U} \rightarrow \text{NTy } \Gamma$

$\Pi \quad : (\text{A} : \text{NTy } \Gamma) \rightarrow \text{NTy } (\Gamma \triangleright \ulcorner \text{A} \urcorner) \rightarrow \text{NTy } \Gamma$

$\ulcorner - \urcorner \quad : \text{NTy } \Gamma \rightarrow \text{Ty } \Gamma$

$\ulcorner \text{U} \urcorner \quad := \text{U}$

$\ulcorner \text{El } t \urcorner \quad := \text{El } t$

$\ulcorner \Pi \text{ A B} \urcorner := \Pi \ulcorner \text{A} \urcorner \ulcorner \text{B} \urcorner$

α -normal types form sets

The encode-decode argument:

$\text{Code} : \text{NTy } \Gamma \rightarrow \text{NTy } \Gamma \rightarrow \text{hProp}$

$\text{Code } \mathbf{U} \quad \mathbf{U} := \mathbb{1}$

$\text{Code } (\mathbf{El } t) \quad (\mathbf{El } t') := (t = t')$

$\text{Code } (\mathbf{\Pi } A B) (\mathbf{\Pi } A' B') := (c : \text{Code } A A') \times \text{Code } ((\text{decode } c)_* B) B'$

otherwise $:= \mathbb{0}$

$\text{decode} : \text{Code } A A' \rightarrow A = A'$

By induction, we have $\text{Code } A A' \cong (A = A')$, which implies $(A = A')$ is a proposition, that is, $\text{NTy } \Gamma$ is a set.

To show that $\text{Ty } \Gamma$ is a set, we want that $\text{NTy } \Gamma \cong \text{Ty } \Gamma$, so we define the following:

$$\llbracket A \rrbracket \quad : (A : \text{NTy } \Gamma) \times (\ulcorner A \urcorner = A)$$

$$\llbracket U \rrbracket \quad := (U, \text{refl})$$

$$\llbracket \text{El } t \rrbracket \quad := (\text{El } t, \text{refl})$$

$$\llbracket A[\sigma] \rrbracket \quad := ?$$

Substitution of α -normal types

$-[-]$: NTy $\Gamma \rightarrow$ Sub $\Delta \Gamma \rightarrow$ NTy Δ

$U[\sigma]$:= U

$(El\ t)[\sigma]$:= $El\ (t[\sigma])$

$(\Pi\ A\ B)[\sigma]$:= $\Pi\ (A[\sigma])\ (\ulcorner\ \urcorner[\]_*\ (B[\sigma^+]))$

$\ulcorner\ \urcorner[\]$: $\ulcorner\ A\ \urcorner[\sigma] = \ulcorner\ A[\sigma]\ \urcorner$

$[id]$: $A[id] = A$

$[o]$: $A[\sigma \circ \delta] = A[\sigma][\delta]$

Substitution of α -normal types (coherences)

$$\begin{array}{ccc}
 \ulcorner A \urcorner[\text{id}] & & \\
 \ulcorner \square \urcorner \downarrow & \searrow [\text{id}] & \\
 \ulcorner A[\text{id}] \urcorner & \xrightarrow{[\text{id}]} & \ulcorner A \urcorner
 \end{array}$$

$$\begin{array}{ccc}
 \ulcorner A \urcorner[\sigma \circ \delta] & \xrightarrow{[\circ]} & \ulcorner A \urcorner[\sigma][\delta] \\
 \ulcorner \square \urcorner \downarrow & & \ulcorner \square \urcorner \downarrow \\
 \ulcorner A[\sigma \circ \delta] \urcorner & \xrightarrow{[\circ]} & \ulcorner A[\sigma][\delta] \urcorner \\
 \ulcorner \square \urcorner \downarrow & & \ulcorner \square \urcorner \downarrow \\
 \ulcorner A[\sigma \circ \delta] \urcorner & \xrightarrow{[\circ]} & \ulcorner A[\sigma][\delta] \urcorner
 \end{array}$$

Example proof goal

$$\begin{array}{ccc} \Gamma \Pi A B \Gamma [\sigma \circ \delta] & \xrightarrow{[\circ]} & \Gamma \Pi A B \Gamma [\sigma][\delta] \\ \downarrow \Gamma \Gamma [] & & \downarrow \Gamma \Gamma [] \\ \Gamma (\Pi A B) [\sigma \circ \delta] \Gamma & \xrightarrow{[\circ]} & \Gamma (\Pi A B) [\sigma][\delta] \Gamma \end{array}$$

Example proof goal (computed)

$$\begin{array}{ccc}
 (\Pi \ulcorner A \urcorner \ulcorner B \urcorner)[\sigma \circ \delta] & \xrightarrow{[\circ]} & (\Pi \ulcorner A \urcorner \ulcorner B \urcorner)[\sigma][\delta] \\
 \downarrow \Pi & & \downarrow \Pi \\
 \Pi(\ulcorner A \urcorner[\sigma \circ \delta])(\ulcorner B \urcorner[(\sigma \circ \delta)^+]) & & (\Pi(\ulcorner A \urcorner[\sigma])(\ulcorner B \urcorner[\sigma^+]))[\delta] \\
 \downarrow \ulcorner & & \downarrow \ulcorner \\
 \Pi(\ulcorner A \urcorner[\sigma \circ \delta])\ulcorner B \urcorner[(\sigma \circ \delta)^+] & & (\Pi(\ulcorner A \urcorner[\sigma])\ulcorner B \urcorner[\sigma^+])[\delta] \\
 \downarrow \ulcorner & & \downarrow \ulcorner \\
 \Pi \ulcorner A \urcorner[\sigma \circ \delta] \ulcorner B \urcorner[(\sigma \circ \delta)^+] & & (\Pi \ulcorner A \urcorner[\sigma] \ulcorner B \urcorner[\sigma^+])[\delta] \\
 \downarrow \ulcorner & & \downarrow \Pi \\
 \Pi \ulcorner A \urcorner[\sigma \circ \delta] \ulcorner B \urcorner[(\sigma \circ \delta)^+] & & \Pi(\ulcorner A \urcorner[\sigma][\delta])(\ulcorner B \urcorner[\sigma^+][\delta^+]) \\
 \downarrow \ulcorner & & \downarrow \ulcorner \\
 \Pi \ulcorner A \urcorner[\sigma \circ \delta] \ulcorner B \urcorner[(\sigma \circ \delta)^+] & & \Pi(\ulcorner A \urcorner[\sigma][\delta])\ulcorner B \urcorner[\sigma^+][\delta^+] \\
 \downarrow \ulcorner & & \downarrow \ulcorner \\
 \Pi \ulcorner A \urcorner[\sigma \circ \delta] \ulcorner B \urcorner[(\sigma \circ \delta)^+] & \xrightarrow{[\sigma^+]} & \Pi \ulcorner A \urcorner[\sigma][\delta] \ulcorner B \urcorner[\sigma^+][\delta^+]
 \end{array}$$

Example proof

$\llbracket A \rrbracket \quad : (A : \text{NTy } \Gamma) \times (\Gamma A^\top = A)$

$\llbracket U \rrbracket \quad := (U, \text{refl})$

$\llbracket \text{El } t \rrbracket \quad := (\text{El } t, \text{refl})$

$\llbracket A[\sigma] \rrbracket := (\llbracket A \rrbracket[\sigma], \Gamma^\top [])$

$\llbracket [\text{id}] \rrbracket := ([\text{id}], \dots)$

...

The groupoid-syntax is a set

The result

We have $\text{NTy } \Gamma \cong \text{Ty } \Gamma$, which implies $\text{Ty } \Gamma$ is a set.

By induction, the groupoid-syntax isomorphic to the set-syntax, thus we can interpret the set-syntax into the set model.

$$\text{set-syntax} \longrightarrow \text{groupoid-syntax} \longrightarrow \text{set model}$$

We did not need full normalization, α -normalization works even with an extensional identity type.

Open question: equations in Ty , e.g. Booleans with large elimination:

$$\text{ElimBool} : \text{Ty } \Gamma \rightarrow \text{Ty } \Gamma \rightarrow \text{Tm } \Gamma \text{ Bool} \rightarrow \text{Ty } \Gamma$$

$$\text{Bool}\beta_1 : \text{ElimBool } A \ B \ \text{false} = A$$

$$\text{Bool}\beta_2 : \text{ElimBool } A \ B \ \text{true} = B$$

Groupoid categories with families

Groupoid CwFs (synthetic)

A category \mathbf{Con}

A pseudofunctor \mathbf{Ty} from \mathbf{Con}^{op} to the bicategory of h-groupoids

A presheaf \mathbf{Tm} over $\int \mathbf{Ty}$

Context comprehension

Definable components of \mathbf{Ty} :

$$\mathbf{Tym} \quad : \quad \mathbf{Ty} \Gamma \rightarrow \mathbf{Ty} \Gamma \rightarrow \mathbf{hSet}$$

$$\mathbf{Tym} A B := (A = B)$$

$$- \circ - \quad : \quad \mathbf{Tym} A B \rightarrow \mathbf{Tym} B C \rightarrow \mathbf{Tym} A C$$

$$\mathbf{inv} \quad : \quad \mathbf{Tym} A B \rightarrow \mathbf{Tym} B A$$

$$-[-] \quad : \quad \mathbf{Tym} A B \rightarrow (\sigma : \mathbf{Sub} \Delta \Gamma) \rightarrow \mathbf{Tym} (A[\sigma]) (B[\sigma])$$

$$\circ[] \quad : \quad (f \circ g)[\sigma] = f[\sigma] \circ g[\sigma]$$

Groupoid CwFs (non-synthetic)

A category \mathbf{Con}

A pseudofunctor \mathbf{Ty} from \mathbf{Con}^{op} to the bicategory of groupoids

A presheaf \mathbf{Tm} over $\int \mathbf{Ty}$

Context comprehension

Some components of \mathbf{Ty} :

$$\mathbf{Tym} \quad : \quad \mathbf{Ty} \Gamma \rightarrow \mathbf{Ty} \Gamma \rightarrow \mathbf{hSet}$$

$$- \circ - \quad : \quad \mathbf{Tym} A B \rightarrow \mathbf{Tym} B C \rightarrow \mathbf{Tym} A C$$

$$\text{inv} \quad : \quad \mathbf{Tym} A B \rightarrow \mathbf{Tym} B A$$

$$-[-] \quad : \quad \mathbf{Tym} A B \rightarrow (\sigma : \text{Sub } \Delta \Gamma) \rightarrow \mathbf{Tym} (A[\sigma]) (B[\sigma])$$

$$\circ[] \quad : \quad (f \circ g)[\sigma] = f[\sigma] \circ g[\sigma]$$

Category CwFs

A category \mathbf{Con}

A pseudofunctor \mathbf{Ty} from \mathbf{Con}^{op} to the bicategory of categories

A presheaf \mathbf{Tm} over $\int \mathbf{Ty}$

Context comprehension

Some components of \mathbf{Ty} :

$$\mathbf{Tym} \quad : \quad \mathbf{Ty} \Gamma \rightarrow \mathbf{Ty} \Gamma \rightarrow \mathbf{hSet}$$

$$- \circ - \quad : \quad \mathbf{Tym} A B \rightarrow \mathbf{Tym} B C \rightarrow \mathbf{Tym} A C$$

$$-[-] \quad : \quad \mathbf{Tym} A B \rightarrow (\sigma : \mathbf{Sub} \Delta \Gamma) \rightarrow \mathbf{Tym} (A[\sigma]) (B[\sigma])$$

$$\circ[] \quad : \quad (f \circ g)[\sigma] = f[\sigma] \circ g[\sigma]$$

Comprehension categories

A category Con

A fibration $p : \text{Ty} \rightarrow \text{Con}$

A cartesian morphism preserving functor χ from Ty to Con^{\rightarrow} , such that the following diagram commutes:

$$\begin{array}{ccc} \text{Ty} & \xrightarrow{\chi} & \text{Con}^{\rightarrow} \\ & \searrow p & \swarrow \text{cod} \\ & \text{Con} & \end{array}$$

Conjecture: the 2-category of comprehension categories is equivalent to some 2-category of category CwFs.

Conclusion

Conclusion

We defined groupoid CwFs as a generalization of CwFs, where types are groupoids rather than sets.

The initial groupoid CwF with type formers (the groupoid-syntax) is “coherent”, types form sets, proven using α -normalization.

This allows us to interpret the set-syntax into the set model.

We formalized this in Cubical Agda.
